# 1 Interlaboratory comparison test Volatile halogenated hydrocarbons (VHH) – C59

## 1.1 Participants and time schedule

- Number of registrations: 18
- Number of submitted data records: 17
- Dispatch of samples: 5<sup>th</sup> June 2018
- Closing date for submission of data: 3<sup>rd</sup> July 2018

To anonymize results, each laboratory was given a laboratory code on a random basis.

## 1.2 Sampling, sample material and distribution

The following samples were made available:

- 1 Sample surface water (C59 A)
- 1 Sample ground water (C59 B)

The sampling of the ground- and surface water was carried out on 4<sup>th</sup> June 2018.

Both samples were stored at < 4 °C until further processing.

The samples were partly spiked with specific substances and were filled into bottles under continuous stirring to achieve homogeneous samples. The samples were dispatched on 5<sup>th</sup> June 2018.

Each participant received:

- 2 samples (each 600 ml), each filled in 600 ml Aluminium bottles

## 1.3 Control testing

During filling the bottles, aliquots of each sample were collected randomly for control testing. Testing was performed close to the time of sample dispatch. The parameters were determined by an external laboratory (accredited according to ISO/IEC 17025 standard).

In the parameter-oriented evaluation, the results of the control testing are given in the form of arithmetic means of the detected concentrations as control test ± U.

## 2 Evaluation

The analytical results had to be made available to the organiser not later than 3<sup>rd</sup> July 2018. Any values received at a later date were not considered. A statistical evaluation of interlaboratory comparison data was only carried out if at least 6 valid results per parameter were available.

To evaluate the data, outliers were detected first by using the outlier test method according to Hampel. Values identified as conspicuous by this test method are marked specifically in the parameter-oriented evaluation.

In justified cases, the outlier elimination was done according to other criteria. This procedure is documented in section 4 of the report.

Further evaluation was performed in accordance with DIN ISO 5725-2. Results < LOQ or < LOD are not taken into account for calculation.

The adjusted average value (after removal of outliers) for all submitted results was used as a basis for the calculation of recovery rates and z-scores.

### **z-Score**

z-Scores were calculated on the basis of the following formula:

$$z-score = \frac{x_i - \bar{X}}{\text{Criteria}}$$

In this context,

$x_i$	is the measurement value of the participating laboratory.
$\bar{X}$	is the target value, normally the average value of the participants' results after removal of outliers; if this approach is not applicable, the target value is assigned according to the procedure given in section 4;
Criteria	is normally the reproducibility standard deviation (sR) calculated from the participants' results (after removal of outliers) in the relevant test round; if this approach is not applicable, the criteria is derived according to the procedure given in section 4

### **Interpretation of z-Scores in the parameter-oriented evaluation:**

- $|z| < 2$  result: good
- $2 < |z| < 3$  result: questionable
- $|z| > 3$  result: not satisfactory

### 3 Representation and interpretation of measurement results

The parameter oriented report shows the measurement values including uncertainty, recovery rate, calculated z-Score and the outliers in tabular form. The results listed in the table are also represented graphically.

The laboratory oriented report shows the results of the individual laboratories, including the recovery rates and z-Scores.

An annotation of the tables and graphics is given in section 5.

### 4 Explanatory notes

As explained in section 2, the z-Score is normally calculated using the reproducibility standard deviation, calculated from the participants' results (after removal of outliers) in the relevant test round. It might occur that the z-Score between -2 and 2 covers a large range of measurement values when the variance of the results is high. On the other hand, the range of good results can be very narrow, when the variation of the participants' results is small.

The recovery rate is calculated for the individual result based on the target value and is thus independent of the reproducibility standard deviation. In the case of a high variance of the results, participants should also consider recovery rates as additional criteria to decide on the necessity of internal quality assurance measures.

This is particularly recommended for parameter 1,1-Dichloroethene in sample A and B.

Sample C59 B: For parameter Tetrachloroethene no target value could be calculated because of the low analyte contents.

## 5 Annotations on tables and charts

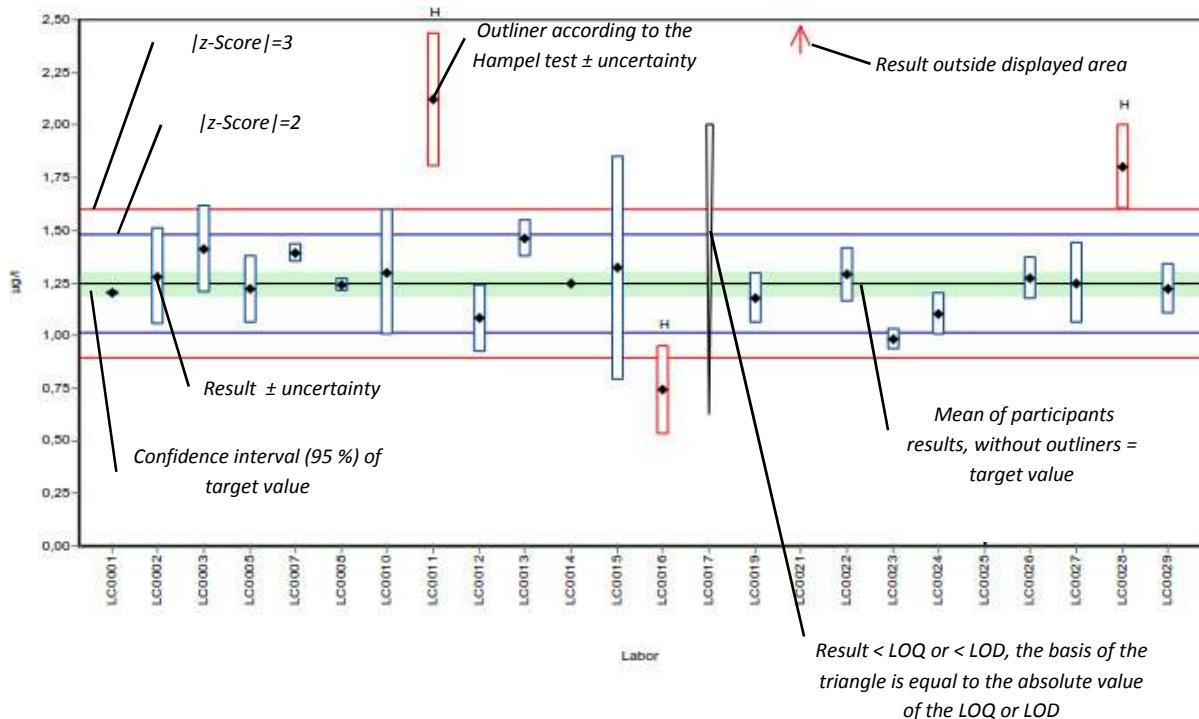

### 5.1 Information and abbreviations in tables

Parameter	Analyte identifier
Sample	Sample identifier
Unit	Given unit for result and uncertainty (e.g. µg/l)
Mean	Mean of the participants results, without outliers (3 significant digits)
CI (99 %)	99% confidence interval (3 significant digits)
Minimum	Minimum of all submitted results, after removal of outliers (3 significant digits)
Maximum	Maximum of all submitted results, after removal of outliers (3 significant digits)
SD	Reproducibility standard deviation, calculated from the participants results, after removal of outliers (3 significant digits)
RSD %	Reproducibility standard deviation, calculated from the participants results relative to the target value, given in %, after removal of outliers (2 significant digits)
Control test value ± U	Mean of control test value ± measurement uncertainty (3 significant digits)
Labcode	Laboratory identifier (anonymized)
Result	Result as indicated by participant (max. 5 decimal places)
± U	Results uncertainty as indicated by participant (max. 5 decimal places)
LOQ	Limit of quantification
LOD	Limit of detection
Recovery	Recovery rate in % based on target value (3 significant digits, max. one decimal place given)
z-Score	Deviation of result based on target value depicted as a multiple of the criteria (3 significant digits, max. 2 decimal places given)
-	<i>No data available</i>
Comments	Comment on the respective result (e.g. H, FN, FP)
H	Outlier according to Hampel-Test
FN	False negative – for a result < LOQ or result < LOD: The absolute value of the LOQ or LOD fulfils the condition of an outlier according to the Hampel test.
FP	False positive – for parameters where no target value is available because of a too low analyte content (n < 6):

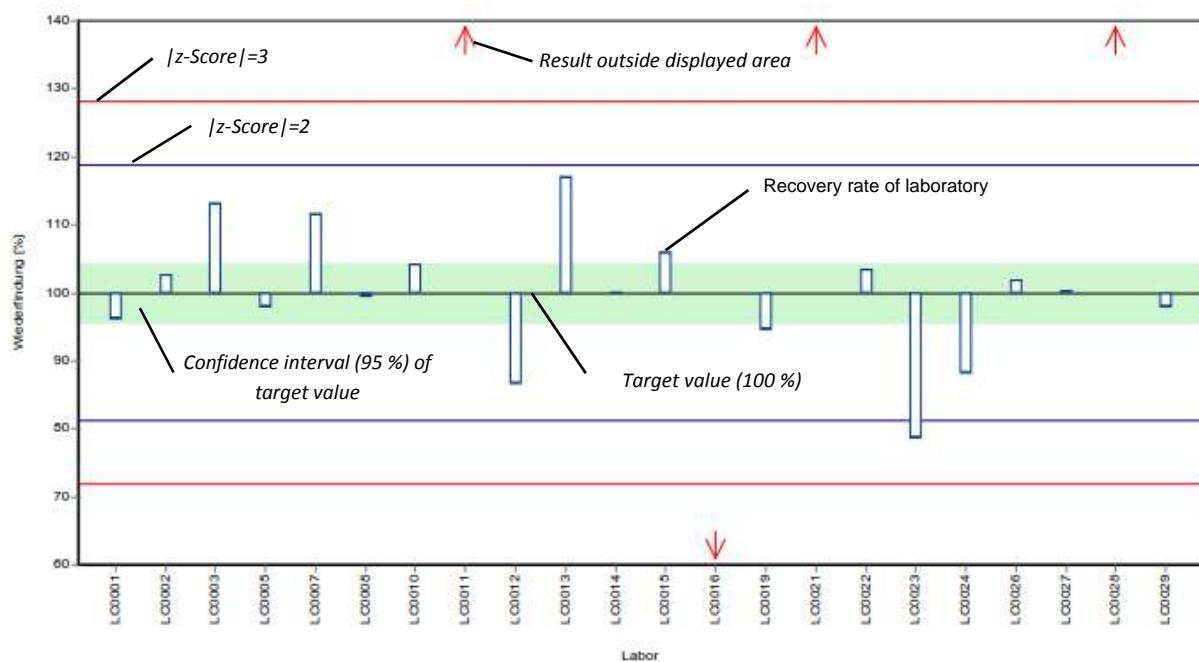

Standard deviation	Result that exceeds the median of the absolute values of the transmitted LOQs or LODs by more than 100 %.
Rel. standard deviation	Reproducibility standard deviation, calculated from the participants results (3 significant digits)
n	Reproducibility standard deviation, calculated from the participants results relative to the target value, given in %, (3 significant digits)
Target value	Number of results
Criteria	Mean of the participants results, without outliers (3 significant digits)
	Criteria for z-Score calculation (if not otherwise stated in clause 4: The given value matches the reproducibility standard deviation, calculated from the participants' results, after removal of outliers (3 significant digits)).

## 5.2 Graphical presentation of results
